

1.

$$\lim_{x \rightarrow \infty} \frac{4x^5 - 2x^3}{3x^5 - 2} = \lim_{x \rightarrow \infty} \frac{4x^5 - 2x^3}{3x^5 - 2} \cdot \frac{\frac{1}{x^5}}{\frac{1}{x^5}} = \lim_{x \rightarrow \infty} \frac{4 - \frac{2}{x^2}}{3 - \frac{2}{x^5}} = \frac{4}{3}.$$

2.

$$\lim_{y \rightarrow -\infty} \frac{y^2 - 2y + 3}{y} = \lim_{y \rightarrow -\infty} \frac{y^2 - 2y + 3}{y} \cdot \frac{\frac{1}{y}}{\frac{1}{y}} = \lim_{y \rightarrow -\infty} \frac{y - 2 + \frac{3}{y}}{1} = -\infty$$

3. (Solution 1) Notice that, since $-1 \leq \sin \theta \leq 1$ and $-1 \leq \cos \theta \leq 1$, then

$$-2 \leq \cos \theta + \sin \theta \leq 2.$$

Any other estimate – as long as it is correct and justified – is fine, e.g. $-37 \leq \cos \theta + \sin \theta \leq 42$ or, the sharpest, $-\sqrt{2} \leq \cos \theta + \sin \theta \leq \sqrt{2}$. We have

$$\lim_{\theta \rightarrow \infty} \frac{-2}{\theta^2} = 0 \quad \text{and} \quad \lim_{\theta \rightarrow \infty} \frac{2}{\theta^2} = 0,$$

and

$$\frac{-2}{\theta^2} \leq \frac{\cos \theta + \sin \theta}{\theta^2} \leq \frac{2}{\theta^2}.$$

By the **squeeze theorem**,

$$\lim_{\theta \rightarrow \infty} \frac{\cos \theta + \sin \theta}{\theta^2} = 0.$$

(Solution 2) We have that $-1 \leq \sin \theta \leq 1$ and $-1 \leq \cos \theta \leq 1$. Since

$$\lim_{\theta \rightarrow \infty} \frac{-1}{\theta^2} = 0 \quad \text{and} \quad \lim_{\theta \rightarrow \infty} \frac{1}{\theta^2} = 0,$$

and

$$\frac{-1}{\theta^2} \leq \frac{\cos \theta}{\theta^2} \leq \frac{1}{\theta^2},$$

by the **squeeze theorem**

$$\lim_{\theta \rightarrow \infty} \frac{\cos \theta}{\theta^2} = 0.$$

Similarly, since

$$\lim_{\theta \rightarrow \infty} \frac{-1}{\theta^2} = 0 \quad \text{and} \quad \lim_{\theta \rightarrow \infty} \frac{1}{\theta^2} = 0,$$

and

$$\frac{-1}{\theta^2} \leq \frac{\sin \theta}{\theta^2} \leq \frac{1}{\theta^2},$$

by the **squeeze theorem**

$$\lim_{\theta \rightarrow \infty} \frac{\sin \theta}{\theta^2} = 0.$$

Since $\lim_{\theta \rightarrow \infty} \frac{\cos \theta}{\theta^2}$ and $\lim_{\theta \rightarrow \infty} \frac{\sin \theta}{\theta^2}$ **exist**,

$$\lim_{\theta \rightarrow \infty} \frac{\cos \theta + \sin \theta}{\theta^2} = \lim_{\theta \rightarrow \infty} \frac{\cos \theta}{\theta^2} + \lim_{\theta \rightarrow \infty} \frac{\sin \theta}{\theta^2} = 0 + 0 = 0.$$

4. Since

$$\lim_{z \rightarrow \infty} \ln(z) = \infty,$$

then

$$\lim_{z \rightarrow \infty} 1 - \ln(z) = -\infty.$$

5. Candidates for **vertical asymptotes**: $2x - 5 = 0$, that is, $x = 5/2$. **Checking that the function is defined around $x = 5/2$** : since

$$(5/2)^2 - 2(5/2) + 3 = 17/4 > 0, \quad (\text{the argument of the square root})$$

the function is defined around $x = 5/2$.

$$\begin{aligned} \lim_{x \rightarrow \frac{5}{2}^-} \frac{x + 1 - \sqrt{x^2 - 2x + 3}}{2x - 5} &= \lim_{x \rightarrow \frac{5}{2}^-} \frac{x + 1 - \sqrt{x^2 - 2x + 3}}{2x - 5} \cdot \frac{x + 1 + \sqrt{x^2 - 2x + 3}}{x + 1 + \sqrt{x^2 - 2x + 3}} = \\ &= \lim_{x \rightarrow \frac{5}{2}^-} \frac{(x + 1)^2 - (x^2 - 2x + 3)}{(2x - 5)(x + 1 + \sqrt{x^2 - 2x + 3})} = \lim_{x \rightarrow \frac{5}{2}^-} \frac{x^2 + 2x + 1 - x^2 + 2x - 3}{(2x - 5)(x + 1 + \sqrt{x^2 - 2x + 3})} = \\ &= \lim_{x \rightarrow \frac{5}{2}^-} \frac{4x - 2}{(2x - 5)(x + 1 + \sqrt{x^2 - 2x + 3})} \end{aligned}$$

We have:

$$\lim_{x \rightarrow \frac{5}{2}^-} (4x - 2) = 4 \cdot \frac{5}{2} - 2 = 8 > 0, \quad \lim_{x \rightarrow \frac{5}{2}^-} (x + 1 + \sqrt{x^2 - 2x + 3}) = \frac{5}{2} + 1 + \sqrt{\frac{17}{4}} > 0.$$

So,

$$\lim_{x \rightarrow \frac{5}{2}^-} \frac{4x - 2}{(2x - 5)(x + 1 + \sqrt{x^2 - 2x + 3})} = -\infty.$$

This means that $x = 5/2$ is a vertical asymptote.

Similarly, we could have checked that

$$\lim_{x \rightarrow \frac{5}{2}^+} \frac{x + 1 - \sqrt{x^2 - 2x + 3}}{2x - 5} = \infty$$

to see that $x = 5/2$ is a vertical asymptote.

Checking for **horizontal asymptotes**. Since $\lim_{x \rightarrow \infty} x^2 - 2x + 3 = \infty$, the **function is defined**

as $x \rightarrow \infty$, so we can compute the limit.

$$\begin{aligned}
\lim_{x \rightarrow \infty} \frac{x+1-\sqrt{x^2-2x+3}}{2x-5} &= \dots = \lim_{x \rightarrow \infty} \frac{4x-2}{(2x-5)(x+1+\sqrt{x^2-2x+3})} = \\
&= \lim_{x \rightarrow \infty} \frac{4x-2}{2x^2-3x-5+(2x-5)\sqrt{x^2-2x+3}} = \\
&= \lim_{x \rightarrow \infty} \frac{4x-2}{2x^2-3x-5+(2x-5)\sqrt{x^2(1-\frac{2}{x}+\frac{3}{x^2})}} = \\
&= \lim_{x \rightarrow \infty} \frac{4x-2}{2x^2-3x-5+(2x-5)x\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}} = \quad (\text{since } \sqrt{x^2} = x \text{ when } x > 0) \\
&= \lim_{x \rightarrow \infty} \frac{4x-2}{2x^2-3x-5+(2x-5)x\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}} \cdot \frac{\frac{1}{x^2}}{\frac{1}{x^2}} = \\
&= \lim_{x \rightarrow \infty} \frac{\frac{4}{x}-\frac{2}{x^2}}{2-\frac{3}{x}-\frac{5}{x^2}+(2-\frac{5}{x})\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}} = 0,
\end{aligned}$$

since the numerator goes to 0 while the denominator goes to $4 \neq 0$. So $y = 0$ is the horizontal asymptote as $x \rightarrow \infty$.

Since $\lim_{x \rightarrow -\infty} x^2 - 2x + x = \infty$, the **function is defined as $x \rightarrow -\infty$** , so we can compute the limit.

$$\begin{aligned}
\lim_{x \rightarrow -\infty} \frac{x+1-\sqrt{x^2-2x+3}}{2x-5} &= \lim_{x \rightarrow -\infty} \frac{x+1-\sqrt{x^2(1-\frac{2}{x}+\frac{3}{x^2})}}{2x-5} = \\
&= \lim_{x \rightarrow -\infty} \frac{x+1-(-x)\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}}{2x-5} = \quad (\text{since } \sqrt{x^2} = -x \text{ when } x < 0) \\
&= \lim_{x \rightarrow -\infty} \frac{x+1+x\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}}{2x-5} = \lim_{x \rightarrow -\infty} \frac{x+1+x\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}}{2x-5} \cdot \frac{\frac{1}{x}}{\frac{1}{x}} = \\
&= \lim_{x \rightarrow -\infty} \frac{1+\frac{1}{x}+\sqrt{1-\frac{2}{x}+\frac{3}{x^2}}}{2-\frac{5}{x}} = \frac{1+1}{2} = 1.
\end{aligned}$$

So $y = 1$ is the horizontal asymptote as $x \rightarrow -\infty$.

6.
 - $f(2) = 2^2 - 3$ is defined;
 - $\lim_{x \rightarrow 2} x^2 - 3 = 2^2 - 3$ exists since $f(x) = x^2 - 3$ is a polynomial;
 - $f(2) = \lim_{x \rightarrow 2} x^2 - 3$.

So the function $f(x) = x^2 - 3$ continuous at $x = 2$ by the continuity checklist.

7. The function $f(x) = \ln(2-x)$ is not defined at $x = 3$, since $2-3 < 0$, so it cannot be continuous at $x = 3$.

8. (Solution 1) The function

$$f(x) = \frac{x^3 + 2x^2 - 1}{x^2 - 3}$$

is not defined when $x^2 - 3 = 0$, that is, when $x = \pm\sqrt{3}$. On the other hand, if $a \neq \pm\sqrt{3}$,

- $f(a)$ is defined;
- $\lim_{x \rightarrow a} \frac{x^3 + 2x^2 - 1}{x^2 - 3}$ exists since $\lim_{x \rightarrow a} x^2 - 3 \neq 0$ and $f(x)$ is a rational function;
- since $\lim_{x \rightarrow a} x^2 - 3 \neq 0$,

$$\lim_{x \rightarrow a} \frac{x^3 + 2x^2 - 1}{x^2 - 3} = \frac{a^3 + 2a^2 - 1}{a^2 - 3} = f(a);$$

so $f(x)$ is continuous when $x \neq \pm\sqrt{3}$ by the continuity checklist. Thus the intervals of continuity are $(-\infty, -\sqrt{3})$, $(-\sqrt{3}, \sqrt{3})$, $(\sqrt{3}, \infty)$.

(Solution 2) The function

$$f(x) = \frac{x^3 + 2x^2 - 1}{x^2 - 3}$$

is not defined when $x^2 - 3 = 0$, that is, when $x = \pm\sqrt{3}$. Since $f(x)$ is a rational function, it is continuous on its domain, that is, when $x \neq \pm\sqrt{3}$. Thus the intervals of continuity are $(-\infty, -\sqrt{3})$, $(-\sqrt{3}, \sqrt{3})$, $(\sqrt{3}, \infty)$.

9. Since $2x + a$ is a linear function, it is continuous for all $x < 0$; since $x^2 + 1$ is a polynomial it is continuous for all $0 < x < 2$; since $bx - 2$ is a linear function it is continuous for all $x > 2$. The only possible points of discontinuity are at $x = 0$ and $x = 2$.

- $f(0)$ is defined;
- to guarantee that $\lim_{x \rightarrow 0} f(x)$ exists, we need $\lim_{x \rightarrow 0^-} f(x)$ and $\lim_{x \rightarrow 0^+} f(x)$ to exist, and $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x)$.

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} 2x + a = a,$$

while

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} x^2 + 1 = 1.$$

So we need $a = 1$.

- When $a = 1$, $\lim_{x \rightarrow 0} f(x) = 1 = f(0)$.
- $f(2)$ is defined;
- to guarantee that $\lim_{x \rightarrow 2} f(x)$ exists, we need $\lim_{x \rightarrow 2^-} f(x)$ and $\lim_{x \rightarrow 2^+} f(x)$ to exist, and $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x)$.

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} x^2 + 1 = 5,$$

while

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} bx - 2 = 2b - 2.$$

So we need $5 = 2b - 2$, that is, $b = 3/2$.

- When $b = 3/2$, $\lim_{x \rightarrow 2} f(x) = 5 = f(2)$.

10. Since $\frac{x^2-4}{x-2}$ is a rational function, it is continuous at all points where $x - 2 \neq 0$, so the only possible discontinuity is at $x = 2$.

- $f(2)$ is defined;

-

$$\lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2} = \lim_{x \rightarrow 2} \frac{(x - 2)(x + 2)}{x - 2} = \lim_{x \rightarrow 2} x + 2 = 4,$$

so the limit exists;

- we need $a = f(2) = \lim_{x \rightarrow 2} f(x) = 4$, so $a = 4$.
