If f'(x) > 0 for all x in an interval (a, b), then...

- (A) f is increasing on (a,b).
  - B. f is decreasing on (a, b).
  - C. f' is increasing on (a, b).
  - D. f' is decreasing on (a, b).

## Finding Absolute Extrema

To find absolute extrema for a function f continuous on a closed interval [a, b]:

- 1. Find all critical numbers for f in (a, b).
- 2. Evaluate f for all critical numbers in (a, b).
- 3. Evaluate f for the endpoints a and b of the interval [a, b].
- **4.** The largest value found in Step 2 or 3 is the absolute maximum for f on [a, b], and the smallest value found is the absolute minimum for f on [a, b].

Find the absolute extrema of the function  $f(x) = 3x^{2/3} - 3x^{5/3}$ 

on the interval [0,8].

$$f'(x) = 3(\frac{2}{3})x^{-1/3} - 3(\frac{5}{3})x^{2/3}$$

$$= \frac{2}{x^{1/3}} - 5x^{2/3} = 0$$

$$= \frac{2}{x^{1/3}} - 5x = 0$$

$$= \frac{2}{x^{1/3}} - 5x = 0$$

$$= \frac{2}{5}$$

$$f(0) = 3(0)^{2/3} - 3(0)^{5/3} = 0$$

$$f(\frac{2}{3}) = 3(\frac{2}{3})^{2/3} - 3(\frac{2}{3})^{5/3}$$

$$= 3(\frac{2}{3})^{2/3} - (\frac{2}{3})^{5/3} \approx 3(0.326)$$

$$f(8) = 3(8)^{2/3} - 3(8)^{5/3} \approx 3(-28) \text{ min af}$$

$$= 3(8^{2/3} - 8^{5/3}) \approx 3(-28) \text{ min af}$$

$$= 3(8^{2/3} - 8^{5/3}) \approx 3(-28) \text{ min af}$$

Example: The total profit P(x) (in thousands of dollars) from a sale of x thousand units of a new product is given by  $P(x) = \ln(-x^3 + 3x^2 + 144x + 1)$  where  $0 \le x \le 10$ . Find the number of units that should be sold in order to maximize the total profit. What is the maximum profit?

Find the absolute max of 
$$P(x)$$
 on  $[0,10]$ 

$$P'(x) = \frac{-3x^{2}+6x+144}{-x^{3}+3x^{2}+144x+1} = 0$$

$$= \frac{-3}{x^{3}+3x^{2}+144x+1} (x^{2}-2x-48) = 0 \qquad CP's$$

$$= \frac{-3}{(x^{3}+3x^{2}+144x+1)} (x-8)(x+6) = 0 \Rightarrow x=8,-6 \leftarrow \text{not in the Jomain}$$

$$P(0) = \left(n(-(0)^{3}+3(0)^{2}+144(0)+1\right) = \left(n(1)^{2}=0\right)$$

$$P(8) = \left(n(-(8)^{3}+3(8)^{2}+144(8)+1\right) = \left(n(833) \leftarrow \text{max at} \right) = 0$$

$$P(10) = \left(n(-10^{3}+3(10)^{2}+144(10)+1\right) = \left(n(741)\right)$$

The U.S. and Canadian exchange rate changes daily. The value of the U.S. dollar (in Canadian dollars) between 2000 and 2010 can be approximated by the function  $f(t) = 0.00316t^3 - 0.047t^2 + .114t + 1.47$  where t is the number of years since 2000. Based on this approximation, in what year during this period did the value of the
